STREAMLINING IT PROCUREMENT: AUTOMATING STANDARD LAPTOP ORDERS WITH FLOW DESIGNER

PROJECT DESIGN

1. Introduction

The project is designed to automate the Standard Laptop procurement process using **ServiceNow Flow Designer**.

The design focuses on creating an automated workflow that processes a Standard Laptop request and generates a Catalog Task for the Hardware team after the required approval. This helps reduce manual intervention and delays in the laptop configuration process.

2. System Design

The system consists of the following main components:

- ServiceNow Service Catalog
- Standard Laptop Catalog Item
- Flow Designer
- Service Catalog Trigger
- Create Catalog Task Action
- Process Engine
- Catalog Task
- Hardware Assignment Group

These components work together to automate the Standard Laptop procurement process.

3. Process Flow

The overall process is designed as follows:

Standard Laptop Order → Service Request → Approval → Flow Execution → Catalog Task Creation → Hardware Assignment → Laptop Configuration

The user first places a Standard Laptop order through the Service Catalog. After the required approval, the Flow processes the request and automatically creates the required Catalog Task.

4. Flow Designer Design

A Flow named **"Standard Laptop Task"** is designed in Flow Designer.

The Flow uses a **Service Catalog trigger** to start the automated process and the **Create Catalog Task** action to generate the required task.

The Flow is configured with:

- **Application:** Global
- **Run As:** System User
- **Trigger:** Service Catalog
- **Action:** Create Catalog Task

5. Catalog Task Design

The Create Catalog Task action is designed with the following values:

Request Item: Requested Item Record

Table: Catalog Task

Short Description: Laptop need to Configured

Description: Laptop need to Configured

Assignment Group: Hardware

Approval: Approved

These values ensure that the generated task contains the required information and is assigned to the Hardware team.

6. Flow Assignment Design

The Standard Laptop catalog item is connected to the created Flow through the **Process Engine** configuration.

The design includes removing the remaining required automations and adding the **Standard Laptop Task** Flow to the Standard Laptop item.

7. Service Catalog Design

The Standard Laptop item is available through the Service Catalog under:

Service Catalog → Hardware → Standard Laptop

The user can select **Order Now** to place a Standard Laptop request.

8. Expected System Output

After the Standard Laptop request is approved, the configured Flow should automatically generate a Catalog Task.

The generated task should display:

- Task Status
- Short Description

- Assignment Group

The task should contain the configured laptop requirement details and be assigned to the **Hardware** group.

9. Design Workflow

The complete design can be represented as:

User

↓

Standard Laptop Catalog Item

↓

Order Request

↓

Approval

↓

Service Catalog Trigger

↓

Create Catalog Task

↓

Hardware Assignment

↓

Laptop Configuration

10. Conclusion

The project design provides a structured workflow for automating Standard Laptop procurement in ServiceNow.

By integrating the Service Catalog, Flow Designer, Process Engine and Catalog Task, the system is designed to automatically generate and assign the required configuration task after approval. This supports a more streamlined procurement process and reduces manual intervention.
